(54) Title: HOT-FILLABLE, BLOW MOLDED CONTAINER

(57) Abstract: A plastic container having a sidewall extending between a shoulder portion and a bottom portion. The sidewall has a substantially oval shape in cross-section and includes a pair of opposing columns and a pair of opposing panels. The columns are located at opposing ends of the oval shape and the panels are located at opposing sides of the oval shape. This configuration allows for reduced as-packaged vacuum pressures when the container is used in hot-fill applications.

## HOT-FILLABLE, BLOW MOLDED CONTAINER

## REFERENCE TO PRIOR PROVISIONAL APPLICATION

This application claims the benefit of prior provisional application number  
5 60/206,516 filed May 22, 2000.

## BACKGROUND OF THE INVENTION

## 1. Field of the Invention

The present invention generally relates to a hot-fillable, blow molded plastic container. More particularly, the invention relates to containers of the  
10 above variety having a novel construction and also having panel sections resisting undesirable deformation in accommodating reductions in product volume during cooling of a hot-filled product.

## 2. Description of the Prior Art

Hot-fillable plastic containers have become commonplace for the package  
15 of products (e.g., juices) which must be filled into the container while hot to provide for adequate sterilization. During filling, the product is typically dispensed into the container while at a temperature of 180° F and above. Such a container is known as a "hot-fill" container. After filling, the container is sealed or capped and, as the product cools, a negative internal pressure forms within  
20 the sealed container. If not properly designed, the negative internal pressure will cause the container to deform in unacceptable ways, both from an aesthetic and a performance perspective.

Biaxially-oriented polyethylene terephthalate (PET) containers have long been used to receive the hot-filled product with a resulting minimal amount of  
25 distortion in the container after cooling. To accommodate the shrinkage and negative internal pressure, the most often employed method is the incorporation of a plurality of recessed vacuum panels into the body portion of the container. The vacuum panels are designed so that as the product cools, they will deform and move inwardly. In one style of container having vacuum panels, the vacuum  
30 panels are equidistantly spaced around the body of the container and separated by land portions. A wrap around label is then used to cover all of the vacuum panels and provide the container with an aesthetically pleasing look.

-2-

A major problem with containers of the above mentioned vacuum panel design is that they are not easily handled by the end consumer, particularly in 48 oz., 64 oz. and larger varieties.

5 Plastic containers having specifically designed gripping areas, hereinafter referred to as pinch-grips, were originally seen in containers for "cold-fill" applications. Not being specifically designed for receiving a hot-fill product, those containers, which did not include vacuum panels, could not accommodate the hot-filling procedure or the decrease in internal pressure which occurs in a hot-fill application.

10 U.S. Patent Nos. 5,141,120 and 5,141,121, both to Brown et al., are believed to be the first patents which disclose vacuum panels and pinch-grips in combination in a hot-fill container. More particularly, these patents illustrate and describe the incorporation of the vacuum panels and the pinch-grips together into a common vacuum/pinch-grip panel of the container.

15 Since the issuance of the Brown et al. patents, other containers have also adopted the vacuum/pinch-grip panel construction. Examples of such patents include U.S. Design Patent No. 334,457 and U.S. Patent Nos. 5,392,937; 5,472,105 and 5,598,941.

20 By combining the pinch-grips and vacuum panels into a common panel as done in the above referenced patents, front and rear label areas can be provided in such a manner that eliminates the need for vacuum panels beneath the label. Instead, horizontal stiffening ribs are provided in these label panel areas for reinforcement and distortion resistance.

25 When properly designed, vacuum panels of all varieties move inwardly as the container's internal pressure decreases and the product cools. As with all PET or other plastic containers, it is desirable to minimize the weight of the container in order to reduce the material cost in forming the container as well as the shipping costs associated with the container. Because of the vacuum applied to these containers and the need to control distortion of the container under vacuum, weight reduction is increasingly hard to achieve.

30 Another variety of container is the squeezable container used to dispense a product such as margarine, catsup, lotion, creams or even liquid beverages.

-3-

A problem associated with containers of this variety is the inconsistent delivery of the amount of product. The amount of product delivered is controlled by the user of the container depending on how much they squeeze the container. While in theory there is a maximum amount of product which can be delivered  
5 from a container with one squeeze, these containers are not designed to deliver a preset amount of product per squeeze.

In view of the above and other limitations, one object of the present invention is to provide a lightweight plastic container which resists deformation and distortion during filling, cooling and subsequent handling of the container,  
10 which can be easily handled by an end consumer.

Another object of the present invention is to provide a plastic container having a vacuum panel structure which resists undesired deformation and distortion during filling and subsequent cooling, and which absorbs a majority of the vacuum pressure applied to the container.

15 A further object of this invention is to provide a squeezable container.

Still another object of this invention is to provide a squeezable container wherein a controlled amount of product is dispensed per squeeze.

#### SUMMARY OF THE INVENTION

In achieving the above and other objects, the present invention provides  
20 a hot-fillable, blow molded plastic container suitable for receiving a product which is initially filled in a hot state, the container subsequently being sealed so that cooling of the product creates a reduced volume of product and a reduced pressure within the container. Another aspect of the invention is that the container is lightweight, compared to containers of similar size, while still  
25 controllably absorbing the vacuum in the container and providing excellent structural integrity and resistance to top loadings from filler valves and alike. These aspects are achieved through implementation of a novel sidewall construction. Finally, the container of the present invention is also a squeezable container which delivers or dispenses a predetermined amount of product per  
30 squeeze. When used in this capacity, the container can be used in non-hot or cold fill applications as well as hot-fill applications.

Additional objects, features and advantages of the present invention will

-4-

become apparent to a person skilled in the art after consideration of the following description, taken in conjunction with the appended claims and figures.

#### BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is a side elevational view of a container embodying the principles  
5 of the present invention;

Figure 2 is a front elevational view of the container shown in Figure 1;

Figure 3a is a cross-sectional view taken substantially along line 3-3 of  
Figure 1 of a container embodying the principles of the present invention and  
generally illustrates the container shape prior to deflection under vacuum forces;

10 Figure 3b is a cross-sectional view similar to that seen in Figure 3a and  
generally illustrates the container shape after deflection under vacuum forces;

Figure 4 is a cross-sectional view taken substantially along line 4-4 in  
Figure 2 through the shoulder of the container;

Figure 5 is a cross-sectional view taken substantially along line 5-5 in  
15 Figure 2 through the bottom of the container;

Figure 6 is a side elevational view of a second embodiment of a container  
according to the present invention;

Figure 7 is a front elevational view of the container shown in Figure 6;

Figure 8 is a chart comparing the weight of current stock containers with  
20 that of the container embodying the principles of the present invention; and

Figure 9 is a table comparing the weight of current stock containers with  
that of the container according to the present invention.

#### DESCRIPTION

Referring now to the drawings, Figure 1 illustrates a hot-fillable, blow  
25 molded plastic container 10 which embodies the principles of the present  
invention. The container 10 is designed to be filled with a product, typically a  
liquid, while the product is in a hot state. After filling, the container 10 is sealed  
and cooled. During cooling, the volume of the product in the container 10  
decreases which in turn results in a decreased pressure within the container 10.  
30 While designed for use in hot-fill applications, it is noted that the container 10  
is also acceptable for use in non-hot-fill applications.

Since the container 10 is designed for "hot-fill" applications, the container

-5-

10 is manufactured out a plastic material, such as polyethylene terephthalate (PET), and is heat set enabling the container 10 to withstand the entire hot-fill procedure without undergoing uncontrolled or unconstrained distortions. Such distortions are typically a result of either the temperature and pressure during the  
5 initial hot-filling operation or the subsequent partial evacuation of the container's interior as a result of cooling of the product. During the hot-fill process, the product is normally heated to a temperature of about 180° F or above and dispensed into the already formed container 10 at these elevated temperatures.

As illustrated in the figures, the container 10 generally includes a neck 12,  
10 which defines a mouth 14, a shoulder portion 16 and a bottom portion 18. As illustrated in Figures 4 and 5, the shoulder portion 16 and the bottom portion 18 are substantially annular or circular in cross-section. A cap (not shown) engages threads 20 on the neck 12 to close the mouth 14 and seal the container 10.

Extending between the shoulder portion 16 and the bottom portion 18 is  
15 a sidewall or body 22 of the container 10. As shown in Figures 3a and 3b, the body 22 has a shape which, when viewed cross-sectionally, is generally elliptical or oval. As illustrated in Figures 1, 3a and 3b, the body 22 includes a front panel 24, which extends vertically between the shoulder portion 16 and the bottom portion 18 of the container 10, and a rear panel 26 that similarly extends  
20 vertically between the shoulder portion 16 and the bottom portion 18 of the container 10. The front and rear panels 24 and 26 are located diametrically opposite one another and, if desired, can be mirror images of one another. Thus, the "front" and "rear" designations are merely used for differentiation purposes and not to designate actual front and rear portions of the container 10.

As illustrated in Figure 1, the front and rear panels 24 and 26 exhibit a  
25 generally inward, arcuate shape from top to bottom between the shoulder portion 16 and the bottom portion 18. This arcuate shape could also be described as concave, defining a hourglass silhouette. The two panels 24 and 26 cooperate to define a minimum diameter for the container 10 generally at about their  
30 longitudinal midpoint.

As illustrated in Figures 3a and 3b, the front and rear panels 24 and 26 are also arcuately shaped in a transverse direction. Transversely, however, the

-6-

arcuate shape is shown as being generally outwardly shaped or convex. Thus, the panels 24 and 26 are structured such that a person handling the container 10 can grasp the container 10 between his/her thumb and fingers of one hand.

The panels 24 and 26 are also provided with ribbings 28. The ribbings 28  
5 provide a grip surface on the panels 24, 26 so that the container 10 can be easily handled by an end consumer. The ribbings 28 may be vertically oriented, as shown in Figures 1 and 2, horizontally oriented, or as a combination of vertically and horizontally oriented. Instead of ribbings 28, other grip features  
10 such as dimples, protrusions or the like, could also be used and are contemplated. In addition, it is anticipated that a decorative embossed motif, such as, a simulation of water beads or the trunk and leaves of a tree, could be superimposed over areas of the shoulder portion 16, the bottom portion 18, and the body 22 to create a continuous integrated appearance.

Separating the front panel 24 from the rear panel 26 is a pair of column  
15 portions 30. Located on opposing sides of the container 10, the column portions 30 are shown in Figures 3a and 3b to be located at the ends of the oval cross-sectional shape of the container 10.

As shown in Figures 1 through 3b, the column portions 30 extend from the shoulder portion 16 to the bottom portion 18. Over their length, the width of  
20 the column portions 30 varies. In Figure 1, the column portions 30 (from the shoulder portion 16 to the bottom portion 18) decrease in width to about their longitudinal midpoint and thereafter increase in width. This width variation is generally symmetrical about the midpoint of the column portions 30 and provides the column portions 30 with a hourglass silhouette. In alternative embodiments,  
25 the column portions 30 width need not vary as described above. Instead they may be asymmetrical about a medial line through the column portions 30 or may increase, decrease or remain constant in width from the shoulder portion 16 to the bottom portion 18.

As illustrated in Figure 2, the column portions 30 also exhibit a shape  
30 which is generally inwardly shaped or concave, at least when the container 10 is initially formed. The radial extent of this concave shape, however, is less than that of the panels 24 and 26 discussed above.

-7-

The transition between the column portions 30, and the panels 24 and 26 comprises a transition wall or step 32 which exhibits a contour similar to that of the column portions 30 themselves. This transition wall 32 defines a step downward from the column portions 30 to the panels 24 and 26 since the column portions 30 are located a greater radial distance from the central axis of the container 10.

A second preferred embodiment, which provides certain additional structural and functional advantages over the first described embodiment, is illustrated in Figures 6 and 7. Like elements have been given like reference numeral designations including a prime ('). The hot-fillable, blow molded plastic container 10' includes a neck 12', which defines a mouth 14', a shoulder portion 16' and a bottom portion 18'. A cap (not shown) engages threads 20' on the neck 12' to close the mouth 14' and seal the container 10'.

A recessed rib or groove 50 is provided in the shoulder portion 16'. A recessed rib or groove 52 is provided in the bottom portion 18'. Recessed ribs or grooves 50 and 52 transition into a sidewall or body 22'. Similar to the body 22 of the container 10, the body 22' of the container 10' has a shape, when viewed cross-sectionally, is generally elliptical or oval. The body 22' includes a front panel 24' and a rear panel 26'. The front panel 24' and the rear panel 26' exhibit a generally inward, arcuate shape which could also be described as concave, defining a hourglass silhouette. The front panel 24' and the rear panel 26' are also arcuately shaped in a transverse direction. Transversely, the arcuate shape is generally outwardly shaped or convex.

Similar to the container 10, the front panel 24' and the rear panel 26' of the container 10' are provided with ribbings 28'. Unlike the container 10, the ribbings 28' of the container 10' are oriented in both vertical and horizontal directions. As illustrated in Figures 6 and 7, front panel 24' and rear panel 26' each include horizontal sections 29 separated by horizontally oriented ribbings 28'. In each horizontal section 29 are located varying amounts of vertically oriented ribbings 28'. As can be appreciated, varying amounts of horizontally oriented and vertically oriented ribbings are contemplated.

-8-

Separating the front panel 24' from the rear panel 26' is a pair of column portions 30'. The column portions 30' exhibit a shape which is generally inwardly shaped or concave, at least when the container 10' is initially formed. The radial extent of this concave shape is less than that of the front panel 24' and the rear panel 26'. The transition between the column portions 30', and the front panel 24' and the rear panel 26' comprises a transition wall or step 32' which exhibits a contour similar to that of the column portions 30' themselves.

The front panel 24', the rear panel 26', the vertically and horizontally oriented ribbings 28' and the column portions 30' of the container 10', when hot-filled, all function similar to the front panel 24, the rear panel 26, the ribbings 28 and the column portions 30 as disclosed above for the container 10.

The containers 10 and 10' as thus described are as originally formed. For the sake of brevity, the discussion will now focus on the container 10, however, it is contemplated that the following would equally apply to the container 10' as well. After being filled with a hot product, capped and cooled, the product within the container 10 decreases in volume. This reduction in volume produces a reduction in pressure. The front and rear panels 24 and 26 of the container 10 controllably accommodate this pressure reduction by being capable of pulling inward, under the influence of the reduced pressure, as shown in phantom lines 34 in Figure 1 and as further shown in Figure 3a. The overall large dimension of the two panels 24 and 26, approximately two-thirds (2/3) of the angular or circumferential extent of the container 10, facilitates the ability of the panels 24 and 26 to accommodate a significant amount of the reduced pressure or vacuum. The panels 24 and 26 are configured such that they absorb at least 50% of the reduced pressure or vacuum, and preferably at least 65%, and most preferably about 85% upon cooling.

As the panels 24 and 26 contract inward, the generally elliptical shape of the body 22 causes the more rigid column portions 30 to deflect more radially outward, providing the column portions 30 with a more upright orientation. This phenomenon is shown in phantom lines 36 in Figure 2 and further shown in Figure 3b. Additionally, when a force is applied to the top of an empty container 10, panels 24 and 26 are caused to contract inward. This in turn causes the

-9-

generally elliptical shape of the body 22 and the column portions 30 to assume a more upright orientation enhancing resistance to the applied force.

In an alternative use, once opened, the containers 10 and 10' are squeezable to dispense product therefrom. Initially, there is little resistance to squeezing against the panels 24 and 26, and 24' and 26'. This is in part because of the panel's large size, and in part because of reduced weight and corresponding wall thickness reductions as discussed below. However, the resistance to further squeezing generally increases in a repeatable manner. This resistance is consistently applied because of the mirrored nature of the panels 24 and 26, and 24' and 26', and because the concave shaped panels 24 and 26, and 24' and 26' resist buckling. As a result, a consistent amount of product is repeatedly delivered from the containers 10 and 10'. By varying panel and column size, the specific amount generally dispensed for a container of a given capacity can be designed into the containers 10 and 10'.

Because of the significant reduction in vacuum pressure capabilities within the containers 10 and 10' after cooling, the containers 10 and 10' have a greater propensity to not retain dents which normally occur during handling or shipping. Containers with higher resultant vacuum pressures (and therefore less vacuum accommodation) tend to retain or hold such dents as a result of the vacuum forces themselves.

The novel shape of the containers 10 and 10' further lends the containers 10 and 10' to light weighting. As compared to containers of similar volumetric sizes and types, the containers 10 and 10' generally realize at least a twenty-two percent (22%) reduction in weight. For example, a current round 500-ml container, approximately sixteen (16) fluid ounces, manufactured by a competitor, weighs 29.0 grams (including the finish) and 24.5 grams (without the finish) (designated as ● in Figures 8 and 9). A 500-ml container according to this invention weighs 22.5 grams (including the finish) and 18 grams (without the finish) (designated as ♦ in Figures 8 and 9), a reduction of 6.5 grams. Reductions of at least 5 grams are expected for other similar containers as well. For comparison, the Assignee of the present invention owns a current round 500-ml container, with vacuum panels, weighing 31.5 grams (including the finish)

-10-

and 27 grams (without the finish) (designated as ■ in Figures 8 and 9). Figures 8 and 9 illustrate, in chart and table form, weight comparisons for current stock containers, and the containers 10 and 10' in an approximately sixteen (16) fluid ounce variety. It should be noted that the weights in the chart of Figure 8 were  
5 calculated without the neck or finish weight while the weights in the table of Figure 9 were calculated with the neck or finish weight. Thus, as illustrated in Figures 8 and 9, the containers 10 and 10' exhibit a significant amount of weight reduction which lends the containers 10 and 10' to light weighting.

10 While the above description constitutes the preferred embodiment of the present invention, it will be appreciated that the invention is susceptible to modification, variation and change without departing from the proper scope and fair meaning of the accompanying claims.

-11-

## CLAIMS

What Is Claimed Is:

1. A biaxially oriented plastic container comprising:  
a neck portion defining a mouth;  
5 a shoulder portion formed with said neck portion and extending downward therefrom;  
a bottom portion forming a base of the container;  
a sidewall extending between and joining said shoulder portion with said bottom portion, said sidewall having a substantially oval shape in cross-section,  
10 said oval shape including a pair of opposing ends and a pair of opposing sides, said sidewall including a pair of opposing columns and a pair of opposing panels, said columns being located at said opposing ends of said oval shape and said panels being located at said opposing sides of said oval shape and between said columns.
- 15 2. The container according to Claim 1 wherein said panels vary in width progressing from a top to a bottom thereof.
3. The container according to Claim 1 wherein said columns vary in width progressing from a top to a bottom thereof.
- 20 4. The container according to Claim 1 wherein said panels are mirror images of one another.
5. The container according to Claim 1 wherein said columns are mirror images of one another.
- 25 6. The container according to Claim 1 wherein a combined circumferential length of said panels is greater than two-thirds ( $2/3$ ) of a total sidewall circumference defined at a midpoint of said sidewall.
7. The container according to Claim 1 wherein said columns include an upper end, a lower end and a center, and decrease in width over at least a portion of their length progressing from said upper end and said lower end toward said center.
- 30 8. The container according to Claim 1 wherein said columns include a longitudinal midpoint and have a minimum width about said longitudinal midpoint.

-12-

9. The container according to Claim 1 wherein said sidewall has an inwardly concave silhouette elevationally viewed from a side facing one of said columns.

5 10. The container according to Claim 1 wherein said sidewall has a first hourglass silhouette when viewed from a side facing one of said columns and has a second hourglass silhouette when viewed from a side facing one of said panels, said second hourglass silhouette being less pronounced than said first hourglass silhouette.

10 11. The container according to Claim 1 wherein a material forming said sidewall is heat treated.

12. The container according to Claim 1 wherein said panels are vacuum panels.

15 13. The container according to Claim 12 wherein said panels absorb greater than 50% of a vacuum applied to the container upon cooling after hot-filling.

14. The container according to Claim 12 wherein said panels absorb greater than 65% of a vacuum applied to the container upon cooling after hot-filling.

20 15. The container according to Claim 12 wherein said panels absorb greater than 85% of a vacuum applied to the container upon cooling after hot-filling.

16. The container according to Claim 12 wherein said panels deflect inwardly under a vacuum and said columns deflect outwardly under a vacuum.

25 17. The container according to Claim 12 wherein said columns deflect to a more vertical orientation under a vacuum.

18. The container according to Claim 12 wherein a 500 ml version weighs less than 23 grams inclusive of said neck portion.

19. The container according to Claim 12 wherein a 500 ml version weighs less than 18.5 grams exclusive of said neck portion.

30 20. The container according to Claim 1 wherein a 500 ml version weighs less than 23 grams inclusive of said neck portion.

-13-

21. The container according to Claim 1 wherein a 500 ml version weighs less than 18.5 grams exclusive of said neck portion.

22. The container according to Claim 1 wherein said panels progressively exhibit an increase in deflection resistance as said panels are  
5 deflected inward.

23. The container according to Claim 22 wherein a substantially consistent dosage of a product contained therein is dispensed upon successive manual inward deflection of said panels.

24. The container according to Claim 12 wherein said panels  
10 progressively exhibit an increase in deflection resistance as said panels are deflected inward.

25. The container according to Claim 24 wherein a substantially consistent dosage of a product contained therein is dispensed upon successive manual inward deflection of said panels.

15 26. The container according to Claim 1 wherein said shoulder portion defines a generally circular cross section immediately adjacent to said sidewall and said bottom portion defines a generally circular cross section immediately adjacent to said sidewall.

27. The container according to Claim 26 wherein said shoulder portion  
20 defines a maximum diameter of the container.

28. The container according to Claim 26 wherein said bottom portion defines a maximum diameter of the container.

29. The container according to Claim 28 wherein said shoulder portion defines a second diameter, said second diameter being substantially equal to  
25 said maximum diameter.

30. The container according to Claim 1 wherein said shoulder portion, said bottom portion and said sidewall include an embossed motif.

(54) Title: HOT-FILLABLE, BLOW MOLDED CONTAINER

(57) Abstract: A plastic container (10) having a sidewall (22) extending between a shoulder portion (16) and a bottom portion (18). The sidewall (22) has a substantially oval shape in cross-section and includes a pair of opposing columns (30) and a pair of opposing panels (24, 26). The columns (30) are located at opposing ends of the oval shape and the panels (24, 26) are located at opposing sides of the oval shape. This configuration allows for reduced as-packaged vacuum pressures when the container (10) is used in hot-fill applications.

## INTERNATIONAL SEARCH REPORT

International Application No

PCT/US 01/16409

## A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 B65D23/10 B65D1/02 B29C49/08

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 B65D B29C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, PAJ, WPI Data

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	EP 0 842 857 A (BEIERSDORF AG) 20 May 1998 (1998-05-20) the whole document	1,4-6,11

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

## \* Special categories of cited documents:

- \*A\* document defining the general state of the art which is not considered to be of particular relevance
- \*E\* earlier document but published on or after the international filing date
- \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*O\* document referring to an oral disclosure, use, exhibition or other means
- \*P\* document published prior to the international filing date but later than the priority date claimed

- \*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- \*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- \*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- \*&\* document member of the same patent family

Date of the actual completion of the international search
